TECHNICAL DESCRIPTIVE DATA ON TWO TYPES OF DIESEL GENERATOR-COMPRESSOR UNITS
(Origin: German; undated; [redacted])

Distributed on 30 January 1953)

25X1A

25X1X

This document consists of photostat copies of two descriptive pamphlets on two types of Diesel generator-compressor units produced by the Schoenebeck Apparatus-Construction Plant. In the first pamphlet, the Schoenebeck Apparatus-Construction Plant is referred to as belonging to the SAG (Soviet Corporation) "Transmasch", and in the second pamphlet, it is described as a Diesel-motor and apparatus plant of the SAG "AMO", Schoenebeck-Elbe. Both pamphlets contain the following information: a) purpose of machine; b) description of machine (dimensions, number of cylinders, etc.); c) detailed technical data on the Diesel motor, electric generator, air compressor, and weight and overall dimensions of the machine.

Both types of the Diesel generator-compressor have the same purpose: to produce direct current of 115 volts and compressed air of 30 atm. The machines are particularly adapted for use as auxiliary units in luggers and seiners. The two types of machines differ in terms of dimensions and capacity. Each pamphlet bears a photograph of the machine described.
